LAB REPORT

on

Artificial Intelligence (23CS5PCAIN)

Submitted by

Kavana M A (1BM23CS145)

in partial fulfillment for the award of the degree of

BACHELOR OF ENGINEERING

in

COMPUTER SCIENCE AND ENGINEERING

B.M.S. COLLEGE OF ENGINEERING

(Autonomous Institution under VTU)

BENGALURU-560019

Aug-2025 to Dec-2025

**B.M.S. College of Engineering,
Bull Temple Road, Bangalore 560019**
(Affiliated To Visvesvaraya Technological University, Belgaum)
Department of Computer Science and Engineering

CERTIFICATE

This is to certify that the Lab work entitled “Artificial Intelligence (23CS5PCAIN)” carried out by **Kavana M A (1BM23CS145)**, who is bonafide student of **B.M.S. College of Engineering**. It is in partial fulfillment for the award of **Bachelor of Engineering in Computer Science and Engineering** of the Visvesvaraya Technological University, Belgaum. The Lab report has been approved as it satisfies the academic requirements in respect of an Artificial Intelligence (23CS5PCAIN) work prescribed for the said degree.

# Run for 8-Queens
simulated_annealing(8)

```

Program 6

Create a knowledge base using propositional logic and show that the given query entails the knowledge base or not.

Algorithm:

Wk-6							
P	Q	R	$Q \rightarrow P$	$P \rightarrow Q$	$Q \vee R$	KB	$R \rightarrow P$
F	F	F	T	T	F	F	T
F	F	T	T	T	F	T	T
F	T	F	F	T	F	T	F
F	T	T	F	T	F	F	T
T	F	F	F	F	F	T	T
T	F	T	T	T	T	T	T
T	T	F	T	F	T	F	F
T	T	T	T	T	T	T	T

Truth table:

KB = $\{P \rightarrow Q, Q \vee R\} \cup \{(Q \rightarrow P) \wedge (P \rightarrow Q)\} \cup \{R \rightarrow P\}$

Models where KB is true:

- $P=F, Q=F, R=T$
- $P=T, Q=F, R=T$

Algorithms:

```

function TT-ENTAILS?(KB, Q)
    inputs: KB, the knowledge base, & propositional logic
            & the query, a sentence in propositional logic
    symbols = a list of the proposition symbols in KB & Q
    return TT-CHECK-ALL(KB, Q, symbols, {})

function TT-CHECK-ALL(KB, Q, symbols, model)
    inputs: KB, the knowledge base, & propositional logic
            & the query, a sentence in propositional logic
            & symbols = a list of the proposition symbols in KB & Q
            & model = a list of symbols & their values
    if EMPTY?(symbols) then
        if Q-TRUE?(KB, model) then return Q=True(model)
        else return Q=False(model)
    else do
        p = FIRST(symbols)
        rest = REST(symbols)
        return TT-CHECK-ALL(KB, Q, rest, model U {p: True}) and
               TT-CHECK-ALL(KB, Q, rest, model U {p: False})
    end

```

A	B	C	AVC	BVTC	KB	$R \rightarrow P$
F	F	F	F	T	F	T
F	F	T	F	F	F	F
F	T	F	F	T	F	T
F	T	T	FT	FT	T	F
F	F	F	T	T	F	T
T	F	F	F	F	F	F
T	F	T	F	T	T	T
T	T	F	T	F	F	F
T	T	T	T	T	(T, T)	T

KB F for models: $(a, b, c) \in \{(F, F, F), (T, F, F), (T, T, F), (T, T, T)\}$.

i.e., whenever KB is True
Q is True.

Code:

```
import itertools
import re
```

```
def evaluate(expr, model):
```

```
    """
```

Evaluate a propositional logic expression under a given model (assignment).

Supported operators:

\sim : NOT

\wedge : AND

\vee : OR

\rightarrow : IMPLIES

\leftrightarrow : BICONDITIONAL

```
"""
```

```
# Replace biconditional and implication first
```

```

    print("\n" + "="*50 + "\n")
```

Program 7

Implement unification in first order logic

Algorithm:

Week - 7

Unification in first order logic

(P1, Q1) and (P2, Q2) are

Algorithm :

Step 1) If Ψ_1 or Ψ_2 is a variable or const, then:

- If Ψ_1 or Ψ_2 are identical, then return NIL
- Else if Ψ_1 is variable,
 - if Ψ_1 occurs in Ψ_2 , return FAILURE
 - else return $(\Psi_1|\Psi_2)$
- Else if Ψ_2 is variable,
 - Ψ_2 occurs in Ψ_1 , then return FAILURE
 - else return $(\Psi_1|\Psi_2)$
- else return failure

Step 2) If the initial predicate symbol in Ψ_1 & Ψ_2 are not same return FAILURE

Step 3) If Ψ_1 and Ψ_2 have different arguments, return FAIL

Step 4) Set Substitution set (SUBST) to NIL.

Step 5) For i=1 to the no. of elements in Ψ_1 ,

- call unify function with ith element of Ψ_1 with ith element of Ψ_2 . Put result into S.
- If S-failure, return failure.
- If S-NIL, do
 - Apply S to remaining of L1 & L2
 - SUBST = APPEND(S, SUBST)

Step 6) Return SUBST.

Ex :

eats(x, Apple), eats(Riya, y)

$x \rightarrow \text{Riya}$

Eats(Riya, Apple), Eats(Riya, y)

$y \rightarrow \text{Apple}$

~~Eats(Riya, Apple), Eats(Eliza, Apple);~~

Ans : 8/10

Code:

```
def is_variable(x):
    return isinstance(x, str) and x.islower()

def is_constant(x):
    return isinstance(x, str) and x[0].isupper()

def occurs_check(var, expr, subst):
    """Check if var occurs in expr after applying subst"""
    if var == expr:
        return True
    elif isinstance(expr, list):
        return any(occurs_check(var, e, subst) for e in expr)
    elif expr in subst:
        return occurs_check(var, subst[expr], subst)
    return False
```

```

Program 9

Create a knowledge base consisting of first order logic statements and prove the given query using Resolution

Algorithm:

Week - 9 29/10/2023

Resolution in FOL

* Create a knowledge base consisting of first order logic statements and prove the given query using resolution

Given KB or premises

1. $\forall x: \text{food}(x) \rightarrow \text{likes}(\text{John}, x)$
2. $\text{food}(\text{Apple}) \wedge \text{food}(\text{Vegetables})$
3. $\text{food}(\text{Vegetables}) \rightarrow \neg \text{alive}(\text{Vegetables})$
4. $\neg \text{alive}(\text{Anil}) \wedge \neg \text{eats}(\text{Anil}, \text{Peanuts})$
5. $\neg \text{eats}(\text{Anil}, \text{Peanuts}) \wedge \neg \text{alive}(\text{Anil})$
6. $\forall x: \text{eats}(\text{Anil}, x) \rightarrow \text{alive}(x)$
7. $\forall x: \neg \text{killed}(x) \rightarrow \text{alive}(x)$ (resolution rule)
8. $\forall x: \text{alive}(x) \rightarrow \neg \text{killed}(x)$ (resolution rule)
9. $\neg \text{killed}(\text{Anil}) \vee \neg \text{alive}(\text{Anil})$
10. $\neg \text{alive}(\text{Anil}) \vee \neg \text{killed}(\text{Anil})$

To prove:

1. $\neg \text{likes}(\text{John}, \text{Peanuts})$

Rules: (1) $\neg a \vee b \rightarrow a \rightarrow b$ (2) $a \wedge b \rightarrow a$

Eliminate implications: $a \rightarrow b \rightarrow a \wedge b$

1. $\neg \text{likes}(\text{John}) \vee \text{likes}(\text{John}, \text{Peanuts})$
2. $\text{food}(\text{Apple}) \wedge \text{food}(\text{Vegetables})$
3. $\text{food}(\text{Vegetables}) \rightarrow \neg \text{alive}(\text{Vegetables})$
4. $\neg \text{alive}(\text{Anil}) \wedge \neg \text{eats}(\text{Anil}, \text{Peanuts})$
5. $\neg \text{eats}(\text{Anil}, \text{Peanuts}) \wedge \neg \text{alive}(\text{Anil})$
6. $\forall x: \neg \text{killed}(x) \rightarrow \text{alive}(x)$
7. $\forall x: \text{alive}(x) \rightarrow \neg \text{killed}(x)$
8. $\neg \text{killed}(\text{Anil}) \vee \neg \text{alive}(\text{Anil})$
9. $\neg \text{alive}(\text{Anil}) \vee \neg \text{killed}(\text{Anil})$

Move negation (\neg) towards

1. $\neg \text{likes}(\text{John}) \vee \text{likes}(\text{John}, \text{Peanuts})$
2. $\text{food}(\text{Apple}) \wedge \text{food}(\text{Vegetables})$
3. $\text{food}(\text{Vegetables}) \rightarrow \neg \text{alive}(\text{Vegetables})$
4. $\neg \text{alive}(\text{Anil}) \vee \neg \text{eats}(\text{Anil}, \text{Peanuts})$
5. $\neg \text{eats}(\text{Anil}, \text{Peanuts}) \wedge \neg \text{alive}(\text{Anil})$
6. $\forall x: \neg \text{killed}(x) \rightarrow \text{alive}(x)$
7. $\forall x: \text{alive}(x) \rightarrow \neg \text{killed}(x)$
8. $\neg \text{killed}(\text{Anil}) \vee \neg \text{alive}(\text{Anil})$

Renaming variables

1. $\neg \text{likes}(\text{John}) \vee \text{likes}(\text{John}, \text{Peanuts})$
2. $\text{food}(\text{Apple}) \wedge \text{food}(\text{Vegetables})$
3. $\text{food}(\text{Vegetables}) \rightarrow \neg \text{alive}(\text{Vegetables})$
4. $\neg \text{alive}(\text{Anil}) \vee \neg \text{eats}(\text{Anil}, \text{Peanuts})$
5. $\neg \text{eats}(\text{Anil}, \text{Peanuts}) \wedge \neg \text{alive}(\text{Anil})$
6. $\forall x: \neg \text{killed}(x) \rightarrow \text{alive}(x)$
7. $\forall x: \text{alive}(x) \rightarrow \neg \text{killed}(x)$
8. $\neg \text{killed}(\text{Anil}) \vee \neg \text{alive}(\text{Anil})$

Resolution by contradiction

Assume: $\neg \text{likes}(\text{John}, \text{Peanuts}) \rightarrow \text{food}(x) \vee \text{likes}(\text{John}, x)$

Resolution steps:

1. $\neg \text{food}(x) \vee \text{likes}(\text{John}, x)$
2. $\text{food}(\text{Apple}) \wedge \text{food}(\text{Vegetables})$
3. $\text{food}(\text{Vegetables}) \rightarrow \neg \text{alive}(\text{Vegetables})$
4. $\neg \text{alive}(\text{Anil}) \wedge \neg \text{eats}(\text{Anil}, \text{Peanuts})$
5. $\neg \text{eats}(\text{Anil}, \text{Peanuts}) \wedge \neg \text{alive}(\text{Anil})$
6. $\forall x: \neg \text{killed}(x) \rightarrow \text{alive}(x)$
7. $\forall x: \text{alive}(x) \rightarrow \neg \text{killed}(x)$
8. $\neg \text{killed}(\text{Anil}) \vee \neg \text{alive}(\text{Anil})$

Assumption is false

Resolution

Step 1: Eliminate biconditionals & implications:

1. $\neg (\text{A} \leftrightarrow \text{B}) \rightarrow (\neg \text{A} \wedge \text{B}) \vee (\text{A} \wedge \neg \text{B})$
2. $\neg (\text{A} \rightarrow \text{B}) \rightarrow (\text{A} \wedge \neg \text{B})$
3. $\neg (\text{A} \wedge \text{B}) \rightarrow \neg \text{A} \vee \neg \text{B}$
4. $\neg (\text{A} \vee \text{B}) \rightarrow \neg \text{A} \wedge \neg \text{B}$

Step 2: Standardize variable y by renaming theorem

Step 3: Skolemize

Step 4: In $\exists \text{x} \text{ Rich}(\text{x})$, becomes "Rich(x)" where y is the new skolem constant.

Step 5: Drop universal quantifiers

Step 6: Distribute \wedge over \vee :

$$(\neg \text{A} \wedge \text{B}) \vee \text{C} \equiv (\neg \text{A} \vee \text{C}) \wedge (\text{B} \vee \text{C})$$

Code:

STEP 1. Input FOL Statements

FOL_statements = {

- 'a': " $\forall x: \text{food}(x) \rightarrow \text{likes}(\text{John}, x)$ ",
- 'b': " $\text{food}(\text{Apple}) \wedge \text{food}(\text{Vegetables})$ ",

Program 10

Implement Alpha-Beta Pruning.

Algorithm:

Week - 10

Alpha-Beta Pruning

($\alpha = \infty$) & ($\beta = -\infty$) after ($\alpha > \beta$) no more pruning

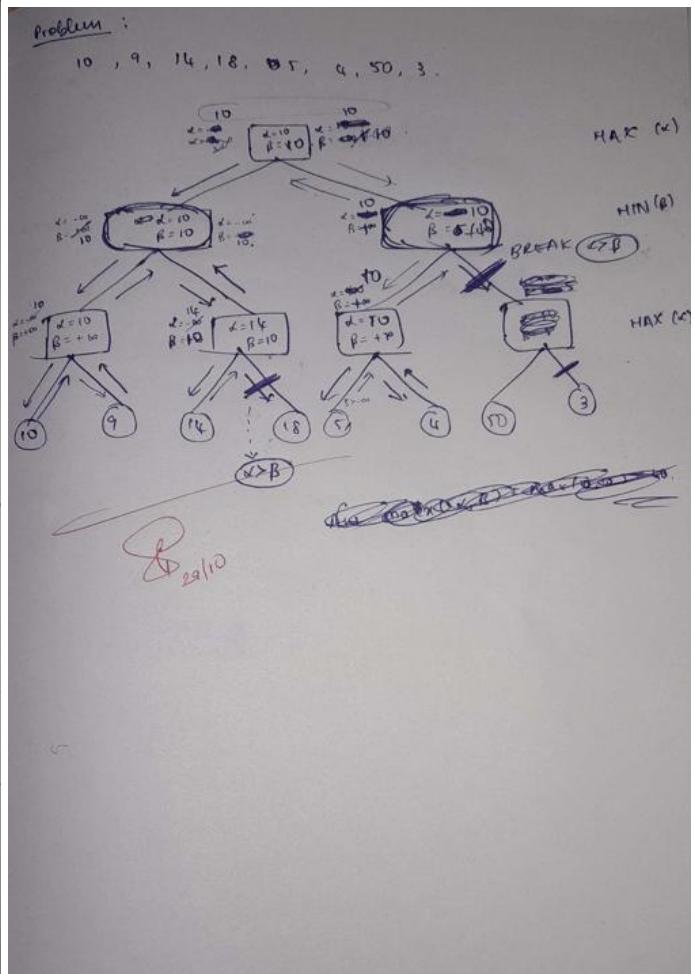

Algorithm :

```

function A-B-seach(state) returns an action
    v ← MAX-VALUE (state, - $\infty$ , + $\infty$ )
    return the actions in ACTIONS (state) with value v
function MAX-VALUE (state,  $\alpha$ ,  $\beta$ ) returns a utility state-value
    if TERMINAL-TEST (state) then return UTILITY (state)
    for each a in ACTIONS (state) do
        v ← MAX (v, MIN-VALUE (RESULT (s, a),  $\alpha$ ,  $\beta$ ))
    when v is if  $v \geq \beta$  then return v
     $\alpha \leftarrow \max (\alpha, v)$ 
    return v

function MIN-VALUE (state,  $\alpha$ ,  $\beta$ ) returns utility value
    if TERMINAL-TEST (state) then return UTILITY (state)
    v ← + $\infty$ 
    for each a in ACTIONS (state) do
        v ← MIN (v, MAX-VALUE (RESULT (s, a),  $\alpha$ ,  $\beta$ ))
        if  $v \leq \alpha$  then return v
         $\beta \leftarrow \min (\beta, v)$ 
    return v

```

Code:

```
import math
```

```
# -----
# Define the game tree structure
# -----
game_tree = {
    'A': ['B', 'C'],
    'B': ['D', 'E'],
    'C': ['F', 'G'],
